**Re:** Memo Week 1

---

This week our team performed the following tasks:

**Aguamilpa Reservoir**

For this project, a water quality model will be designed for Aguamilpa reservoir. This model will be developed using the water quality and quantity data which will be obtained by counterparts in Mexico.

**El Cajon Reservoir**

Assist ITESO students to perform the water quality model for El Cajon reservoir developed last year.

Our team completed our work plan which we will be following this semester. The work plan is divided into activities we will be completing each week. We will try to follow this work plan as close as possible but also it is important to note that some of the steps may change as we try to collect more input data.

Also we worked on the web page by making updates and also creating new links. Finish preparing our team webpage to share information with students in Mexico. We linked this website to the main class website. This is the address for the webpage:

<http://www.et.byu.edu/groups/cemexico/2008/AguamilpaEmbalse/>

The webpage includes a link to our team work plan, links to weekly reports that will become active as reports are added, links to important websites that may be referenced for this project, as well as links to team member biographies.

Also this week we also started our training on CE-QUAL-W2. We have been using the wiki webpage and also the manual as our users guide. All the links to the manual and W2 are included in our webpage.
